Leg Mount

Newton noticed quite simply that the more mass something has the more force it takes to move it. I.E. his second law (in laymen's terms): The amount of force needed to move an object is equal to the object's mass times its change in velocity or it's acceleration,

$$\text{Force} = \text{Mass} \times \text{Acceleration}$$

$$F=ma$$

Approximate Analysis Of Terracotta Warrior structural dynamic in a large seismic event at the Asian Art Museum.

$$F = MA$$

Force = 200 pounds x .3 gravities

Force = 60 pounds

Moment force is calculated from
the center of gravity.

Moment Force = 60 (36.5)

Moment Force = 2190 pounds

Overturning Moment

200 pounds

Moment Force @ .3Gs: $36.5'' \times 200\#s(.3G) = 2190$ inch pounds

For every action there is an equal and opposite reaction.

An object is said to be stable when the gravitational resistance is greater than the lateral force.

$$Wd > Fh$$

Weight = 200 pounds
Depth to CG = 6 inches

200 pounds x 6 inches = 1200 inch pounds

Force = 60 pounds
height = 36 inches

60 pounds x 36 inches = 2160 inch pounds

Overturning Moment

1200 pounds < 2160 pounds signifies an unstable shape

The likely place the object will rupture in a seismic event if the feet are bracketed.

Rupture Moment

Force Moment of Rupture @ .3Gs: $33'' \times 200\#s(.3G) = 1980$ inch pounds

THE GREAT WALL OF CHINA
EPILOGUE

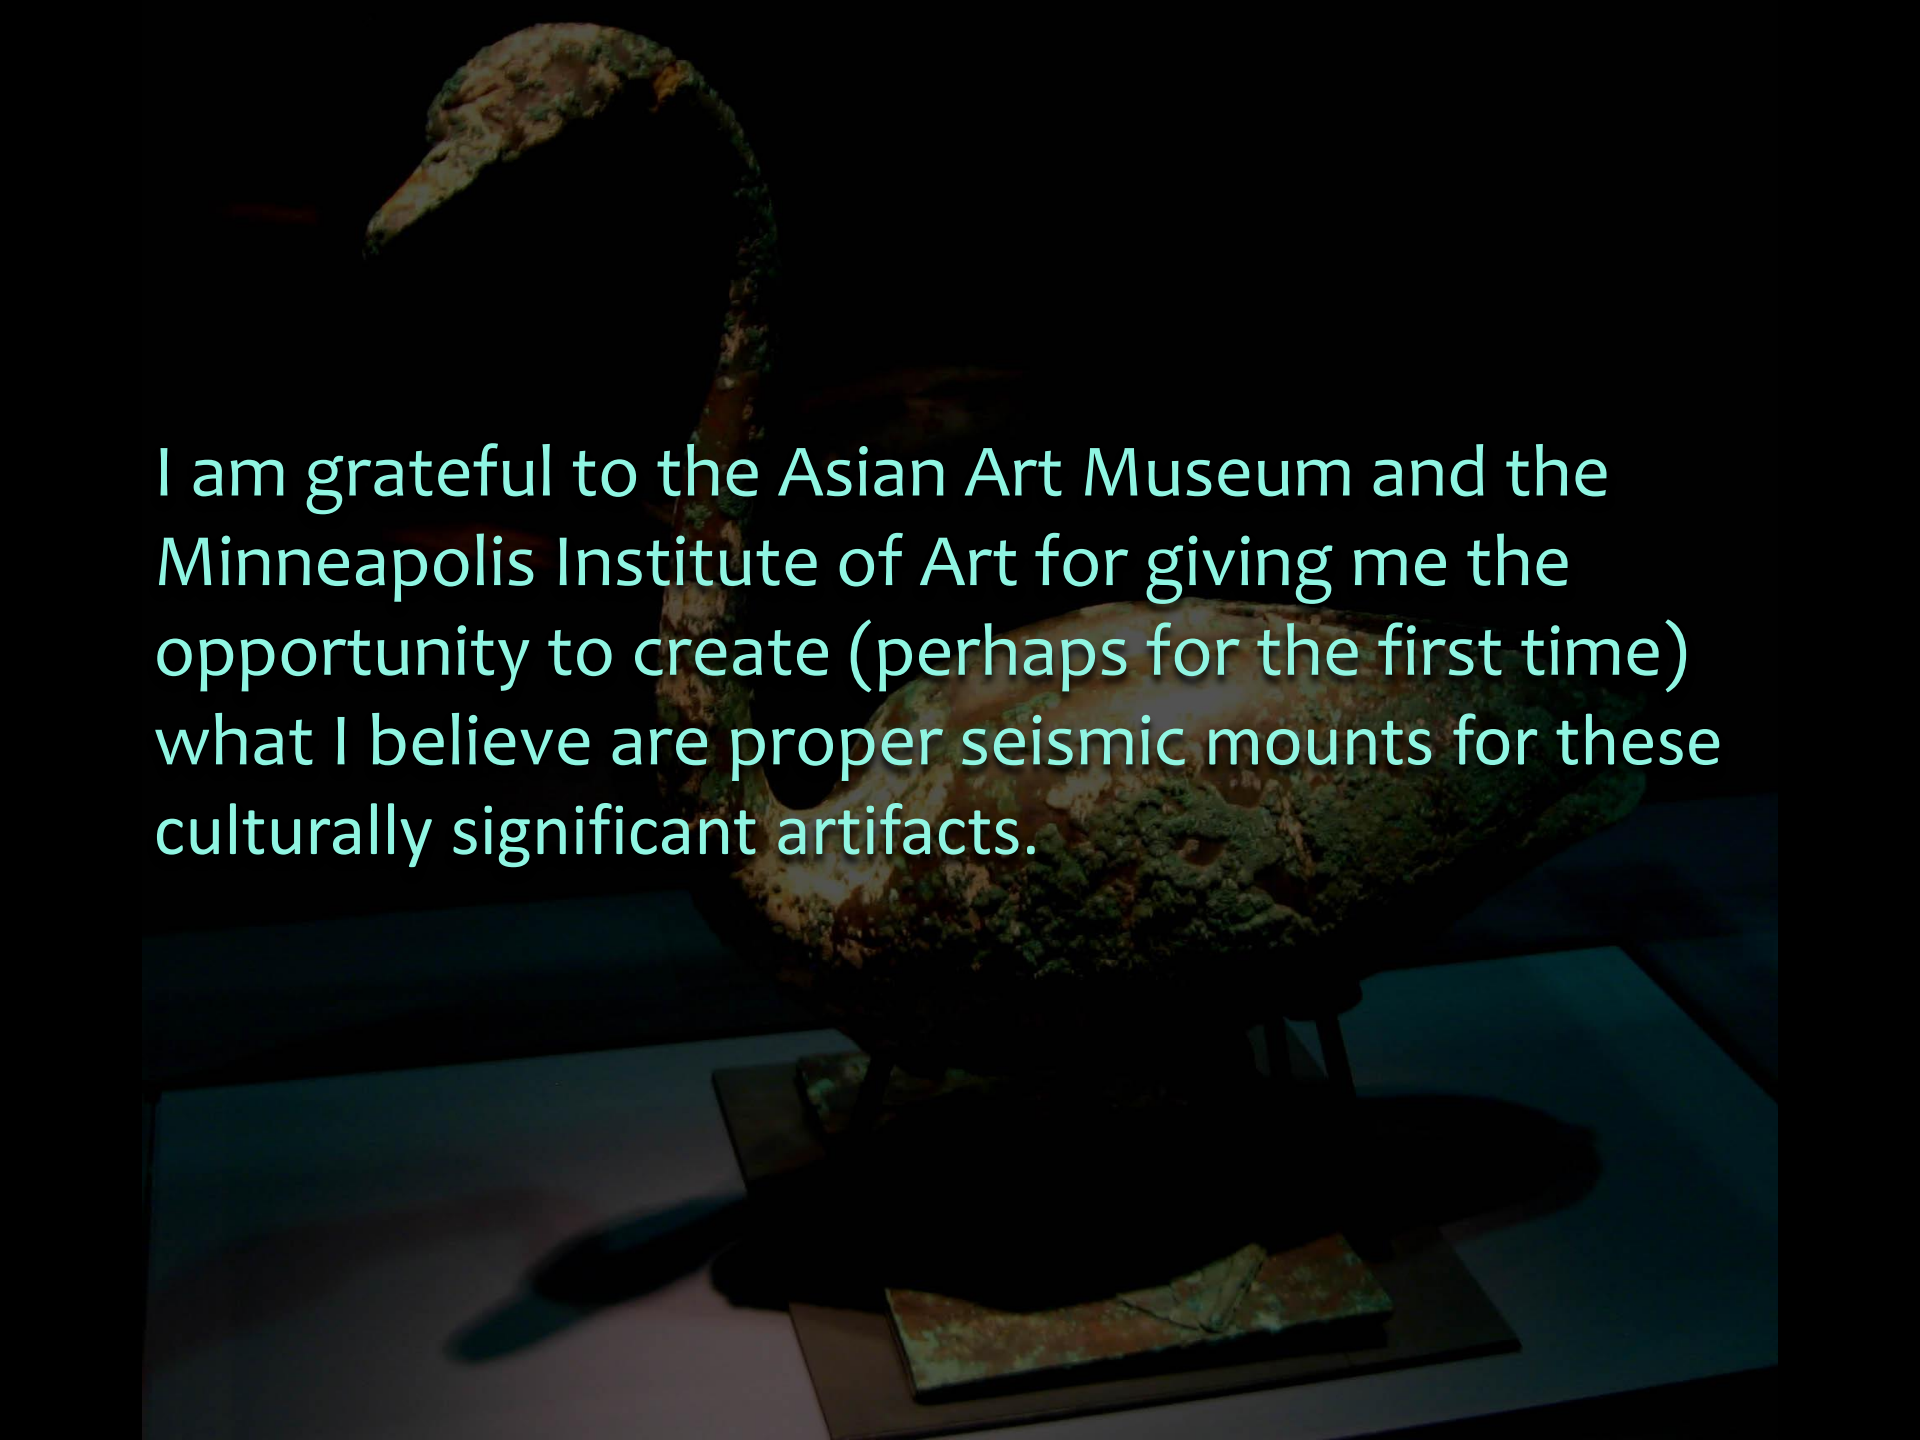

THE GREAT WALL OF CHINA
EPILOGUE

The Warriors were not the only objects to be mounted for earthquake purposes in the show. I needed a small army of mountmakers including my colleagues:

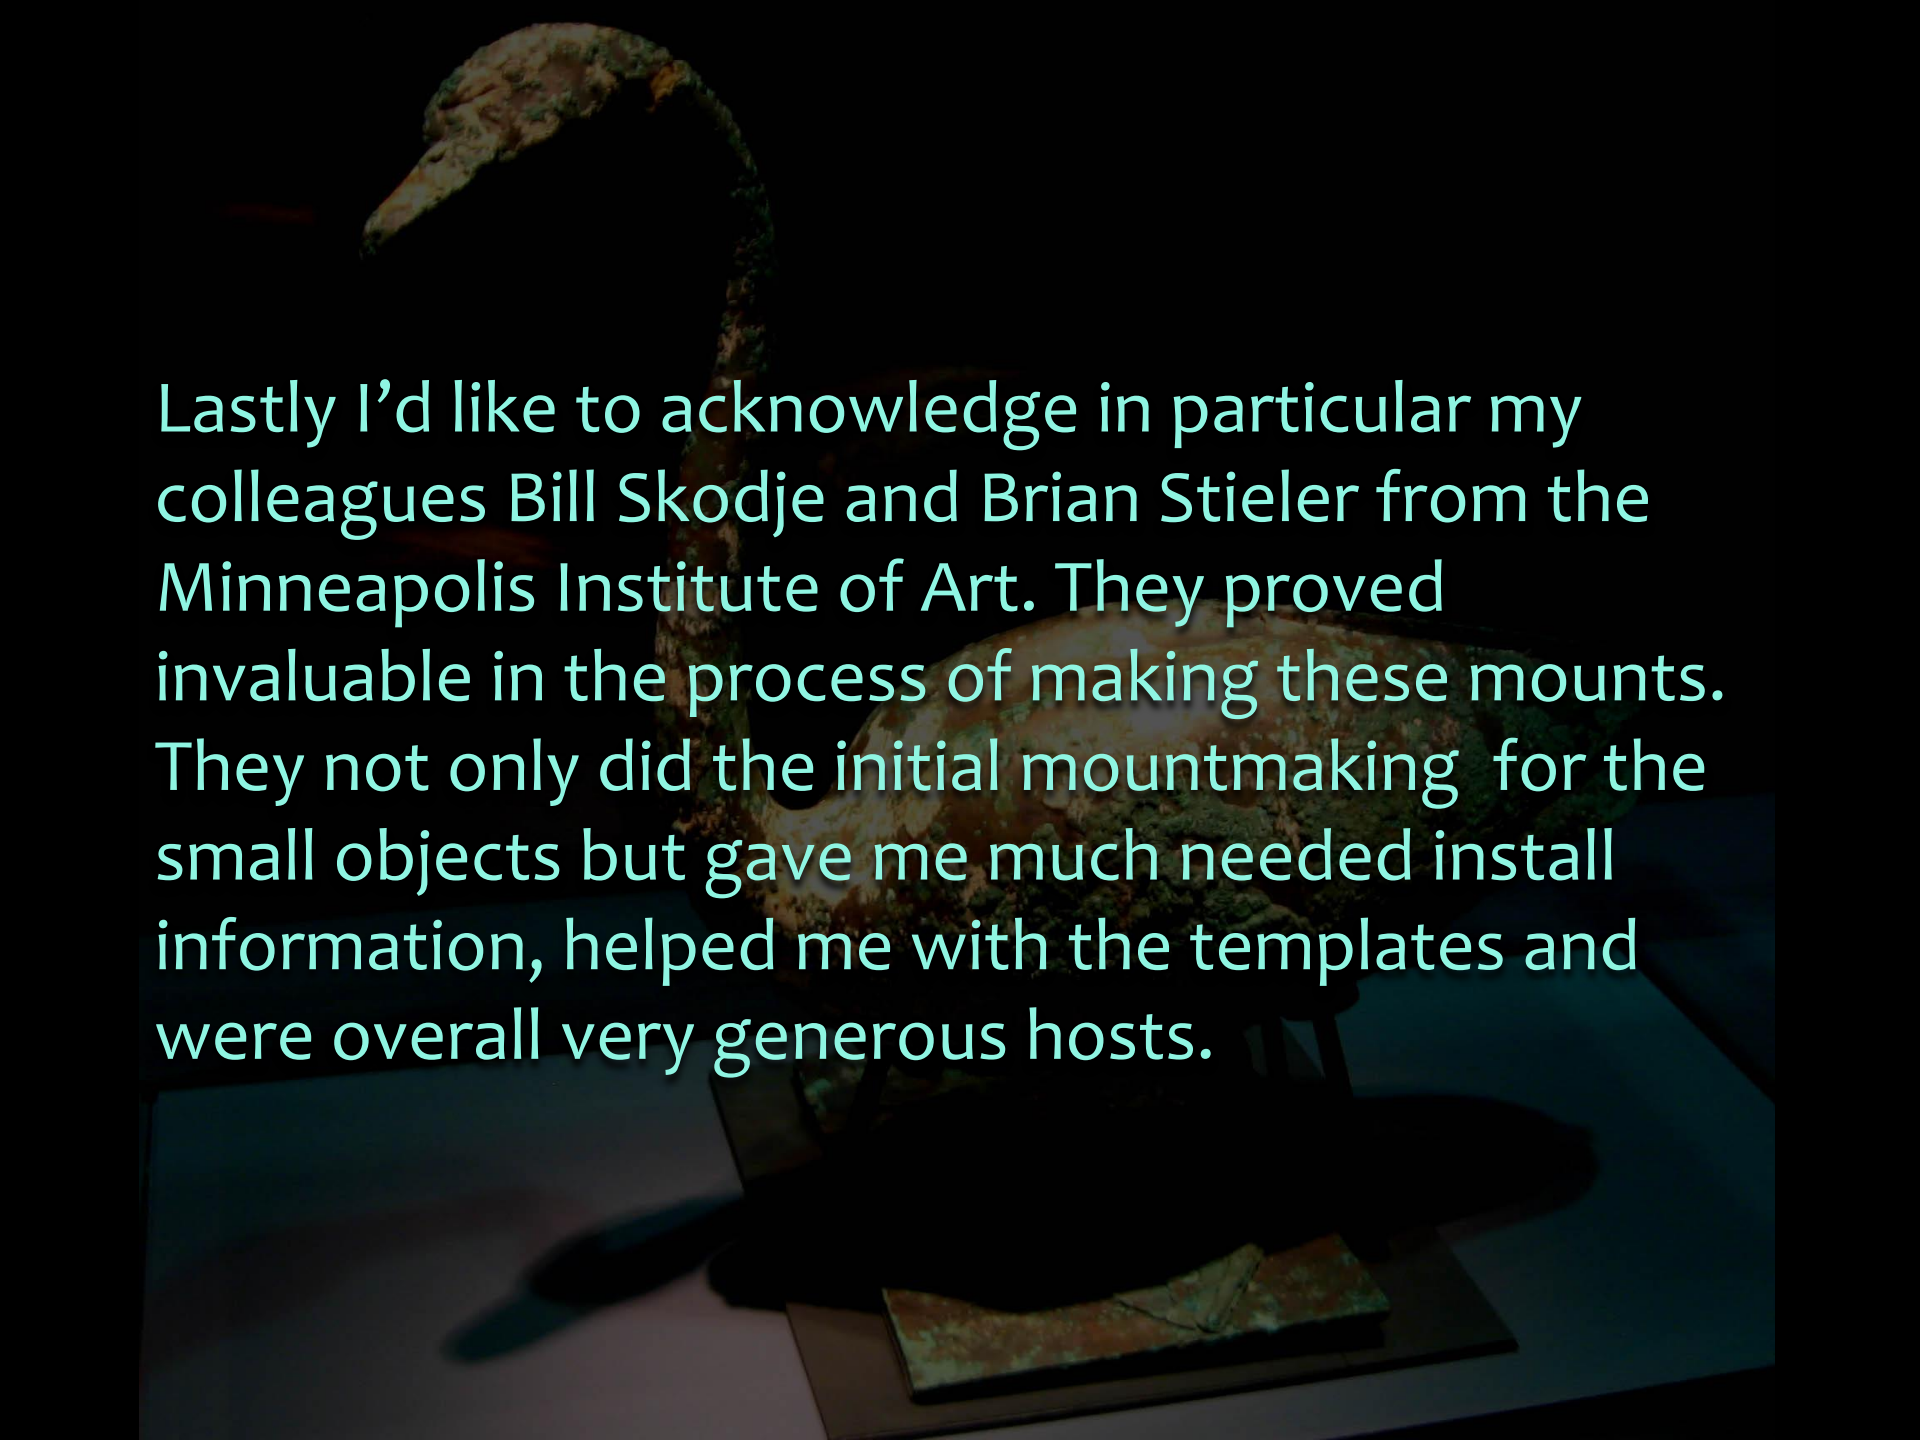

Gina Borg, Jason Webster and Adam Nesbit. This knife as an example needed a new mount just to hold it in one piece.

I am grateful to the Asian Art Museum and the Minneapolis Institute of Art for giving me the opportunity to create (perhaps for the first time) what I believe are proper seismic mounts for these culturally significant artifacts.

Lastly I'd like to acknowledge in particular my colleagues Bill Skodje and Brian Stieler from the Minneapolis Institute of Art. They proved invaluable in the process of making these mounts. They not only did the initial mountmaking for the small objects but gave me much needed install information, helped me with the templates and were overall very generous hosts.
